

Energy Policy

In our principles and guidelines we have committed ourselves to take responsibility for our behaviour and the careful handling of resources. This is cemented in our environmental policy in which we make a commitment to the continuous reduction of emissions and energy consumption.

The continuous improvement of our energy performance is a key objective for a sustainable reduction of costs and an important contribution to maintain our long-term competitive viability.

For the realization of these goals, DREWSEN has implemented an energy management system certified in line with ISO 50001. We will implement the requirements of this accreditation and aim to continually improve the processes of our energy management.

We will regularly monitor that

- the necessary financial and structural requirements are given
- all employees take an active part in the implementation of the energy management system
- the responsibilities are clearly defined
- the relevant laws and regulations are fulfilled
- regular energy efficiency assessments are made
- energy saving measures are planned and implemented
- energy efficiency supporting products are provided
- planned activities to improve energy efficiency are continuously updated
- the results will be measured and monitored in internal audits

DREWSEN promotes the importance of energy efficient behaviour within the company via training and awareness materials for all employees.

Managers are obligated to apply the management methods in their field of responsibility. They have to monitor the effectiveness of these methods regularly and align them to state-of-the-art knowledge and requirements.

Lachendorf, 09.11.2022

Dr. Matthias Rauhut
Executive Director
